

PHP视频教程

主讲: 高洛峰

在PHP中设置分布式memcache存取

无兄弟 不编程!

```
//1. 创建对象
  $mem = new Memcache();
//2. 添加服务
    $mem->addServer("192.168.150.250",11211);
    $mem->addServer("192.168.150.138",11211);
    $mem->addServer("192.168.112.128",11211);
//3. 放置信息
   $mem->add("mystr","hello memcache!",MEMCACHE_COMPRESSED,0);
    $mem->add("myarray",array(10,20,30,40),MEMCACHE_COMPRESSED,0);
    $mem->add("myob",new Stu(),MEMCACHE_COMPRESSED,0);
//4. 获取信息
    echo $mem->get("mystr")."<br/>";
    var_dump($mem->get('myarray'));
   echo "<br/>":
    $mem->get("myob")->getinfo();
```

memcached服务器的安全防护

- 1. 内网访问
 - memcached -d -m 1024 -u root –l 192.168.0.10 –p 11211 –c 1024 start
- 2. 设置防火墙
 - iptables –F
 - iptables –P INPUT DROP
 - iptables –A INPUT –p tcp –s 192.168.0.10 –-dport 11211 –j ACCEPT
 - iptables –A INPUT –p udp –s 192.168.0.10 –-dport 11211 –j ACCEPT

THANK YOU!
